## PROJET DETAILS

| | |
|---|---|
| Project Name | Data And Report Interactive Lineage (DARIL) |
| Project Type | Product Development |
| Project Start Date | 5/19/2023 |
| Project End Date | 7/7/2023 |
| Project Sponsor | John Simeone |
| Primary Driver | Efficiency |

| | |
|---|---|
| Secondary Driver | Risk Mitigation |
| Project Manager/Product Owner | Brian Miller |

# OVERVIEW

This document defines the high-level requirements Data element and Report Interactive Lineage. It will be used as the basis for the following activities:

- Formalizing project understanding and use cases
- Creating solution designs and architecture
- Understanding required data
- Developing scripts and UAT cases
- Determining project completion
- Assessing project success
- Benefit Analysis

# DOCUMENT RESOURCES

| | | |
|---|---|---|
| **Dakshina Verma** | **DQCE Director** | Requestor |
| **Austin Daugherty** | **DQCE Officer** | Developer |
| **Brian Miller** | **DQCE Senior Vice President** | Product Owner |

# GLOSSARY OF TERMS

| **Term/Acronym** | **Definition** |
|---|---|
| DARIL | Data And Report Interactive Lineage |
| POC | Proof of Concept |
| ADS | Authorized Data Source |
| FDN | Force Directed Network |
| PDE | Physical Data Element |
| AIT | Application Inventory Tool |

# PROJET OVERVIEW AND BACKGROUND

Currently, there is a gap in live business intelligence informing a user of stops made by a PDE at AITs while moving downstream in the bank's network. This is currently accomplished through the use of multiple front end mechanisms including SALT, DQE, btConverge, EDR and others. This process can take significant effort and prevents potential issues from being solved in a timely manner.

An earlier POC using data associated to the ADS Griffin was able to demonstrate that a Force Directed Network was capable of visualizing Report to PDE lineage in an effective and interactive manner that allowed for efficient identification of data paths. This initial effort utilized extracted data from multiple sources to drive the FDN.

Based on the outcome of this POC we are beginning the process of productionizing this product beginning with the ADS, CRP. This effort will include making the process replicable and tied to live data feeds so that the visualization changes with core system updates.

The objective of this project is to provide a visualization of how PDE's flow through the Bank's network to allow rapid identification of PDE data lineage.

- Provide a visual of a selected subset of the banks network
- Include PDEs, AITs, and Reports in the visual
- Distinguish ADS' from AITs
- Distinguish those with DART & CC data associated
- Allow user interaction to select a certain lineage

# PROJECT SCOPE

In scope: ERFT AITs, related AITs, PDEs, DARTs and reports

Out of Scope: Any items not enumerated as "In scope"

# STAKEHOLDERS

The following comprises the internal and external stakeholders whose requirements are represented by this document:

| # | **Stakeholders** |
|---|---|
| 1. | DQCE |
| 2. | ADS / AIT Manager |
| 3 | Reporting Team |

# KEY ASSUMPTIONS AND CONSTRAINTS

| # | Assumptions |
|---|---|
| 1 | Data that we need will be made available in a timely manner |
| 2 | Required data exists with the proper fidelity and accuracy |
| 3 | Senior stakeholder will support & advocate for project success |

| | |
|---|---|
| 4 | Technological resources will be made available to complete product development |

| # | Constraints |
|---|---|
| 1 | First round of development will be limited to CRP |
| 2 | Only looking at reports with regulatory concerns |
| | |

## FUNCTIONAL REQUIREMENTS

| | |
|---|---|
| Must Have | • Visualize the path of report to it contributing AIT and identify which PDE's are leveraged within the report.<br>• Selecting an AIT will show all reports that are dependent on PDE's provided by that source<br>• A PDE can be selected and a lineage path to each report it contributes to are visualized<br>• Model can be repointed to a new ADS and run with minimal effort<br>• Paths reflect feed depth |
| Should Have | • Allow filtering to show what feeds, reports and AITs are in scope for active and planned DART tickets<br>• Easy filter capabilities<br>• Web enabled for a wide set of users<br>• Tool tips that can provide high level facts about nodes and paths<br>• Data is exportable to a table format in excel |
| Nice to Have | • Collapsible nodes for easier viewing of large sets.<br>• Active tool tips that provides detailed data on hover over of feeds, PDEs and AITs<br>• Inclusion of non-DART related change efforts as a selectable view |

## NONFUNCTIONAL REQUIREMENTS

The deployed version must be designed in an accessible manner that will allow users without a technical background to use and understand the data that is being displayed.  This front end layer must be deployed in a bank secure environment that will not risk exposure of company confidential data to non-permission parties.

## BENEFITS

### Reduced Time to Research:

Under the current model multiple systems (btConverge, RRT, EDR, DQE, etc.) are used to find the lineage path of single PDEs.  Even in the new EMP future state users will still need to research across multiple hops and will require specialized knowledge to parse the complex nature of the information for individual PDEs and their inherent lineages.  DARIL will eliminate this effort allowing users to visualize multiple PDE and Report lineages at a glance.  To understand the actual time and opportunity cost savings of the product we are proposing a time study to compare the activity using the CRP to report lineages as a use case for effort to be tested on.

Documentation of typical activity performer(s) and other involved party full loaded costs will be need to produce an estimated $ redeployment.

## Lowered Barrier of Entry:

In the current less transparent process (or possibly within EMP) there is a persistent need to understand the "why" of the

DARIL will also reduce the need to be in the know in how data elements can be acquired or how the information can be aligned to communicate.

An obvious advantage here will be the ability for more senior members, who currently perform many of the above actions do to the institutional knowledge required to hand off these tasks to more junior team members.  At an operational risk level this also reduces overall "key man" risks associated with a need for this complex background information.

## Ability to visualize change in impact over time:

Both in the current model and in EMP there is not a way for users to visualizer the impact of change and issue resolution overtime.  DARIL will enable users to understand not only what the current state environment is, but also what the world will look like six months from now.  DARIL will then go one step further beyond simply modeling future state to also show the drivers behind that future state understanding where DARTs will implement changes potentially impacting in scope reports and sources (future iterations will also all visuals that capture CRQs).
